Technical Information - Chinese Pole -

Spatial Requirements

Height minimum 5.2 m, better 6.2 m or higher

Rigging

Chinese Pole requires 3 or 4 load bearing anchor points to guy the pole down to.

All anchor points must be rated to at least 300kg.

If using 3 anchor points there must be 120 degrees between each point if looking from where the base of the pole would be placed (they must approximately make an equilateral triangle).

If using 4 anchor points there must be 90 degrees between each point (points must be approximately in a square).

Optimum height of anchor points is 1.5m, they must not be above 3m. In the absence of structural features these can be created using weights. **Strangebird Zirkus can provide sandbags to create anchor points.**

Where possible, we use an overhead point with a pulley to mount the pole.

RIGGING: The performers are qualified to and will act as riggers of their own equipment.
